05. Conclusion

Introduction

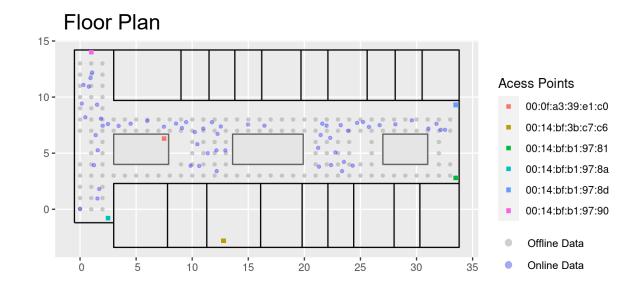

Overview

Problem

Identify the physical location of devices that are connected to the network.

Goal

- Create a model that takes a set of signal strengths of the relevant access points to a connected device.
- Predicts the physical location of that device.
- Quantify the accuracy and precision of the model.

Data Set

Fingerprinting

About

In position estimation, the prior collected and stored measurements of the environment are called **fingerprints**.

The process of collecting signal strength (RSSI) values from the signal transmitter (e.g., smart devices) is called the **offline stage**.

The offline stage creates the foundation for the **online stage**, where a detectable object is placed in the environment to create fingerprints from nearby devices.

Advantages

- Relatively good accuracy is achievable provided that fingerprints are available for small distance intervals.
- Fingerprinting technique is not as vulnerable as radio signal phenomena.

Disadvantages

- Accuracy decreases as signal propagates or changes throughout the space.
- The offline phase may be time consuming and may need to be conducted periodically due to environmental changes.

RSSI Heat Map

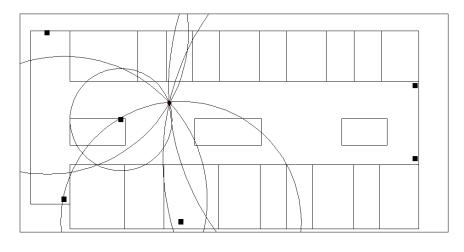

Approaches

Trilateration Technique

Position estimation based on measurements and distance estimates from three (or more) signal transmitters

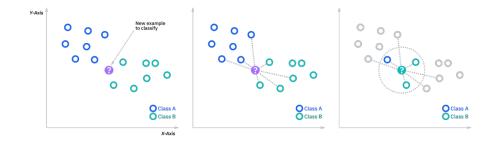

Uses linear models to estimate distance and minimizes distance error.

Nearest Neighbors Technique

Position estimation based on RSSI value of an online fingerprint matching with closest neighbors of offline fingerprints.

The position of the device is then estimated to be the corresponding position of the fingerprint in the offline data having the smallest distance.

Applications

In the Public

- Emergency services
- Indoor map
- Route information, etc.

In the Industry

- Using closest resource in the enterprise
- Privileges based on security regions
- Enhanced 911 (E911) services, etc.

In the Military

- Identification/segregation
- Indoor mapping
- Indoor striking mission, etc.

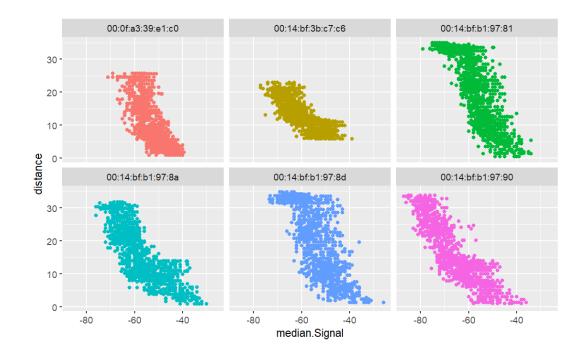

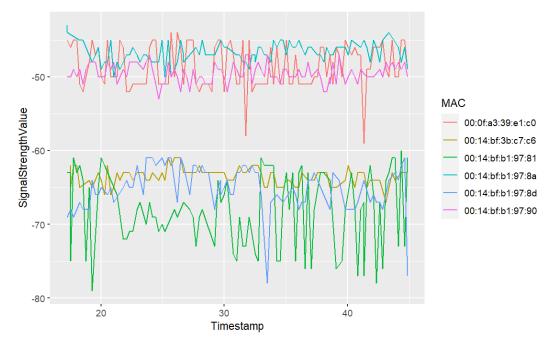

Trilateration Technique

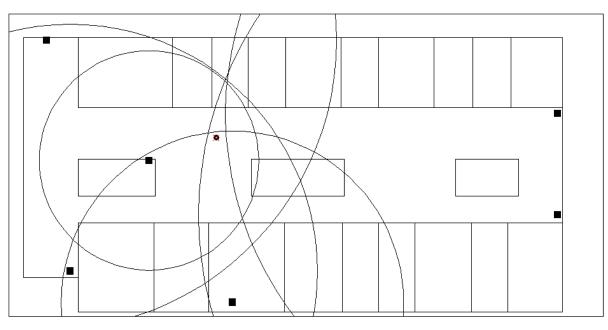

About

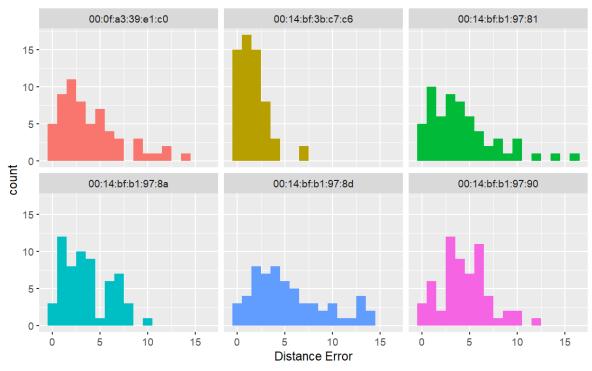

Trilateration/Multilateration

- Signal Strength → Estimated Distances →
 Estimated location
- Simple Linear Model (per MAC address) to estimate distance from Signal Strength
- Optimization algorithm; takes estimated distances, minimizes sum square errors for x or y position

Comparison

Advantages

- Trilateration only requires relatively few computations for position estimation.
- The Trilateration approach generally does not require a comprehensive offline stage.
- No data storage is required other than knowing the location of the signal transmitter.
- The Trilateration algorithms hold potential for estimating precise positions which are not constrained by some predefined granularity.

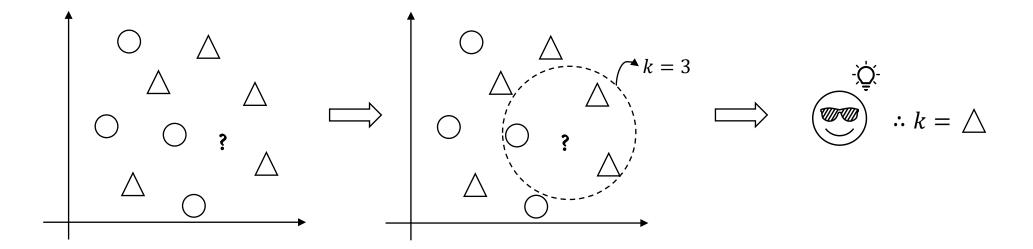

Disadvantages

- The techniques using time stamps, require specialpurpose hardware such that these can be measured precisely.
- The algorithms are vulnerable to radio propagation phenomena like multipath fading, which may result in signals propagating in an indirect line from transmitter to receiver
- If the environment changes significantly, the radio propagation model must be recalibrated.

For k=1

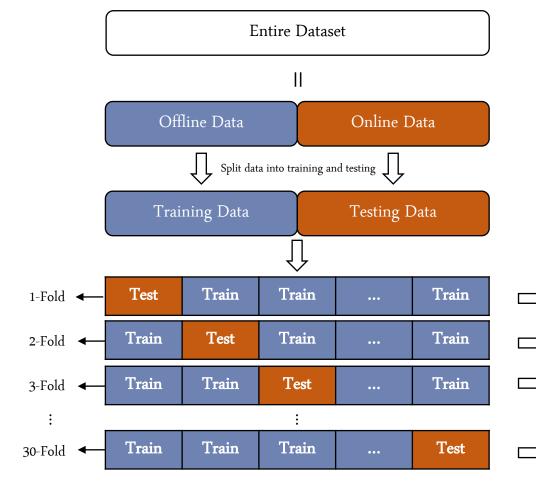

X ₁	Y ₁

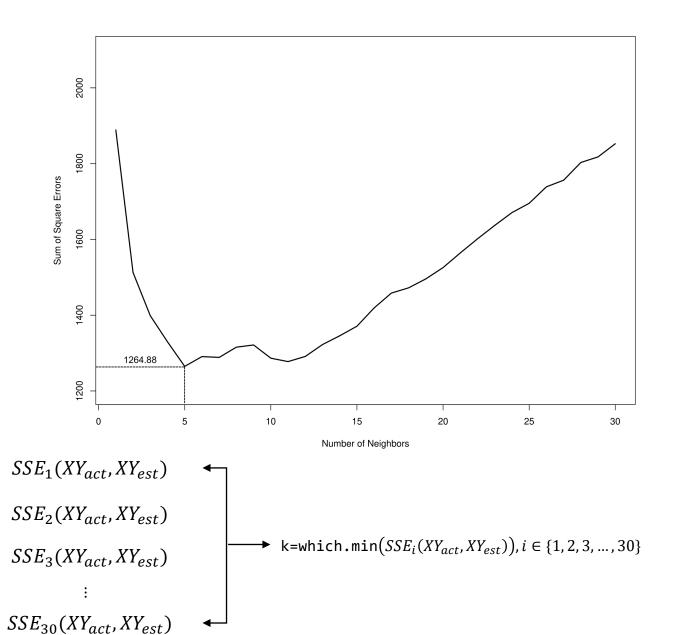

X ₁	Y ₁
X_2	Y_2
X_3	Y_3

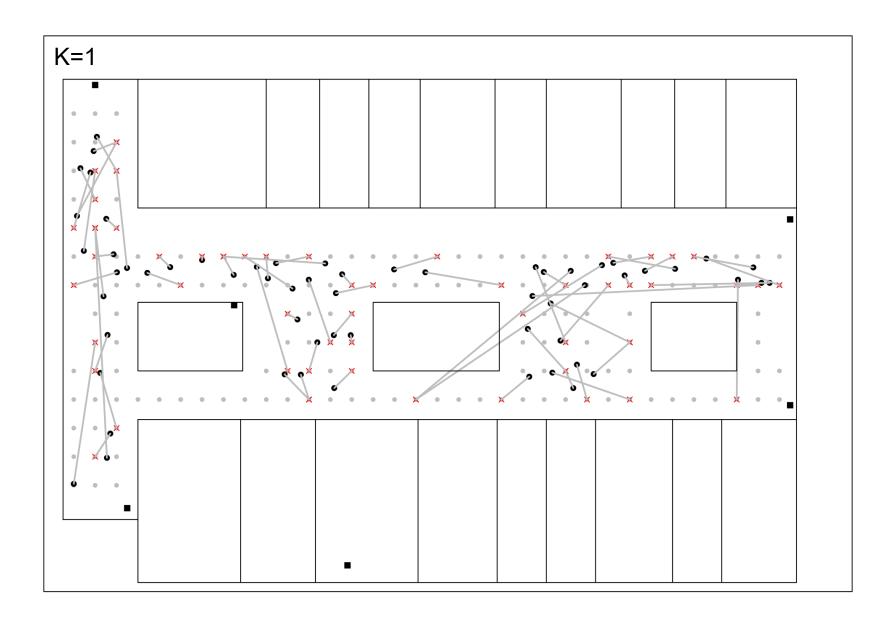

$$(x_1, y_1) = \min\left(\sqrt{(RSSI_i - RSSI_{11})^2}\right)$$

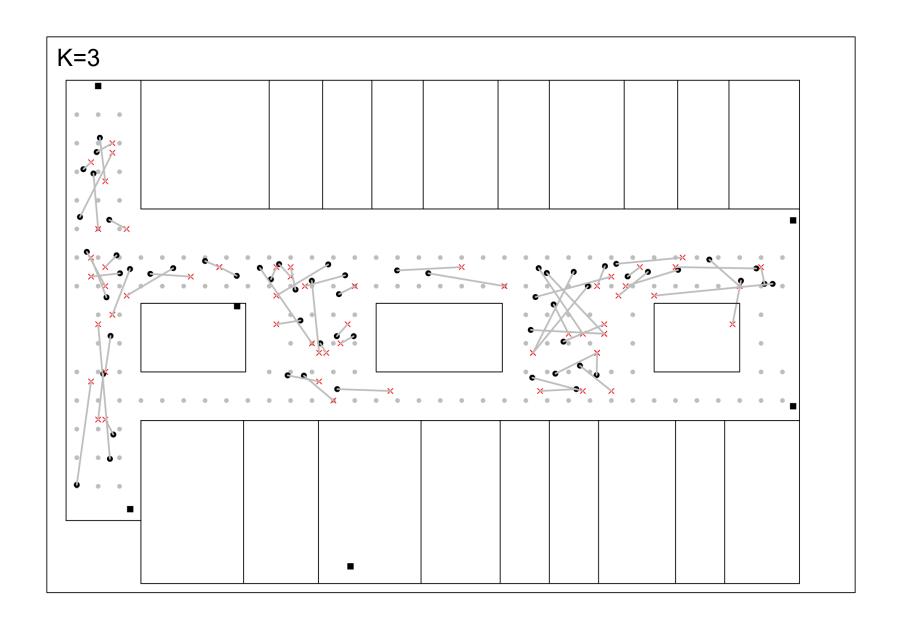

Online Data

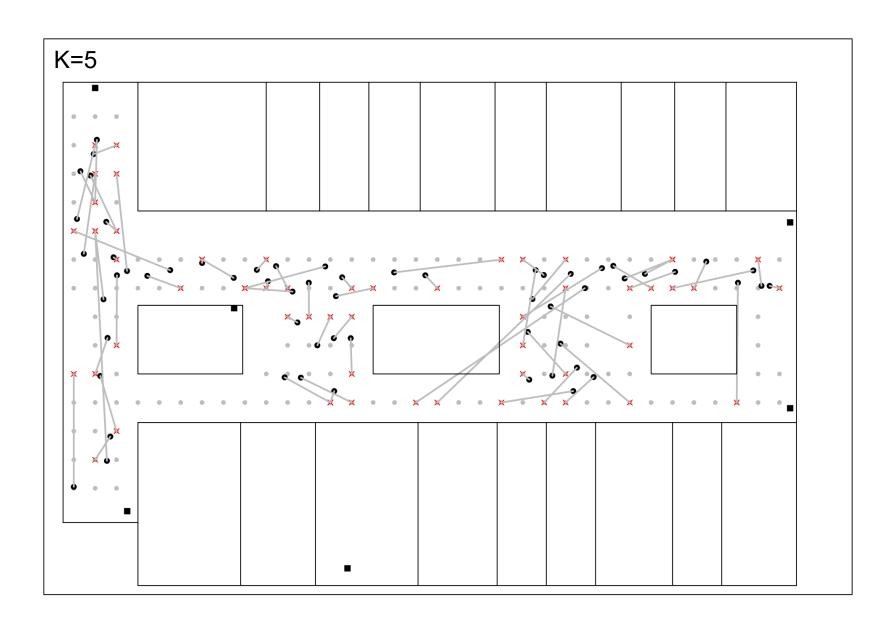

K-fold Cross Validation

Comparison

Advantages

- Very flexible, data-driven
- Simple, fast training process
- Robust to noisy training data
- Effective with large amount of data, where predictor levels are well represented, has good performance

Disadvantages

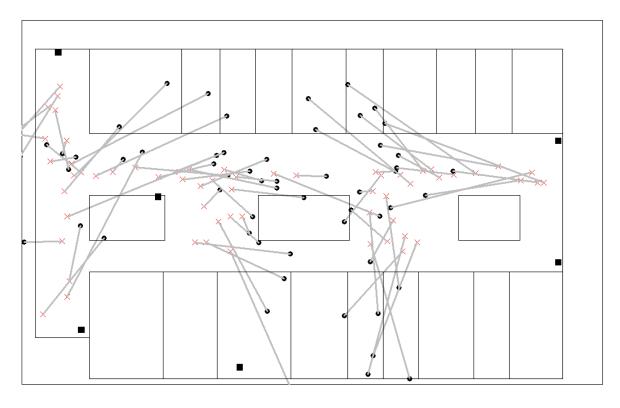

- Biased by value of k
- Computationally intensive for large *k*
- Runs slow being a supervised lazy learning algorithm
- Need LOTS of well-represented training data

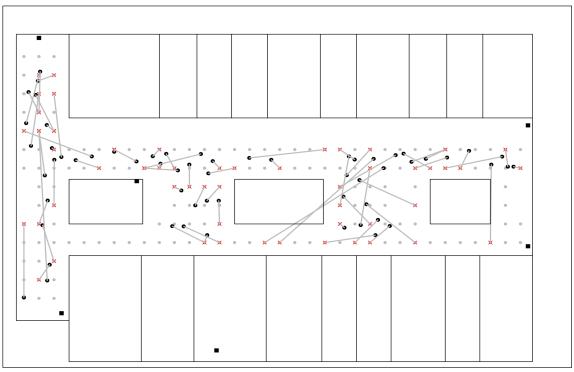

Evaluation

Trilateration vs. KNN

Trilateration Method

KNN Method (k = 5)

Average Error Distance: 4.832989 m

Median Error Distance: 4.955922 m

Average Error Distance: 2.517842 m

Median Error Distance: 1.902775 m

Conclusion
